NETAJI SUBHASH ENGINEERING COLLEGE

SUBJECT :- Research Methodology CS601(6880)

Topic Name :- "**3. Development of working hypothesis & hypothesis testing** "

NAME :- ROHAN KARAK

UNIVERSITY ROLL NO.:- 10900123118

SEMESTER :- 6th **STREAM** :- CSE

CLASS ROLL NO.:- 117 **SECTION :-** B

Development of Working Hypothesis & Hypothesis Testing

1. Introduction :-

Research is a systematic and scientific method of discovering new knowledge or verifying existing facts. Every research study begins with a clear objective and direction. One of the most important elements in research methodology is the formulation of a hypothesis. A hypothesis acts as a guiding principle for the entire research process. It helps the researcher remain focused on specific variables and relationships.

A well-developed hypothesis reduces confusion and gives structure to the study. It provides a clear idea about what the researcher is trying to prove or disprove. Without a hypothesis, research may become directionless and unorganized.

2. Meaning of Hypothesis :-

A hypothesis is a tentative statement or assumption about the relationship between two or more variables. It is not a confirmed fact but a prediction that can be tested through research and experimentation.

In simple words, a hypothesis is an educated guess based on prior knowledge, observation, and theory.

Example:
"Students who study regularly score higher marks than those who study irregularly."

For a hypothesis to be effective, it must be:

- Clear and specific
- Testable and measurable
- Based on logical reasoning
- Related to the research problem

3. Development of Working Hypothesis :-

3.1 Meaning of Working Hypothesis

A working hypothesis is a preliminary assumption made by the researcher at the beginning of the study. It is called "working" because it guides the research work and may be modified during the research process as new information is gathered.

It helps in:

- Selecting research methods
- Identifying relevant data

3.2 Steps in Developing a Working Hypothesis

1. Identification of Research Problem
The first step is to clearly define the research problem. A properly defined problem makes hypothesis formulation easier and more accurate.

2. Review of Literature
The researcher studies books, journals, research papers, and previous studies. This helps in understanding existing knowledge and identifying research gaps.

3. Identification of Variables
The researcher identifies:

- Independent Variable (cause)
- Dependent Variable (effect)

4. Logical Thinking and Theoretical Background
Using theories and logical reasoning, the researcher develops a possible explanation of the relationship between variables.

Example:
"There is a positive relationship between use of technology and student academic performance."

4. Types of Hypothesis :-

1. **Null Hypothesis (H_o)**
   It states that there is no relationship or difference between variables.
   Example: "There is no significant difference in performance between online and offline learning."

2. **Alternative Hypothesis (H_1)**
   It states that there is a relationship or difference between variables.

3. **Directional Hypothesis**
   It specifies the direction of the relationship.
   Example: "Online learning increases academic performance."

4. **Non-Directional Hypothesis**
   It does not specify the direction.
   Example: "There is a relationship between online learning and academic performance.

5. Hypothesis Testing :-

5.1 Meaning

Hypothesis testing is a statistical method used to determine whether there is enough evidence in a sample of data to support or reject a hypothesis. It helps researchers make decisions based on scientific evidence.

5.2 Steps in Hypothesis Testing

Step 1: Formulate Hypotheses

- Null Hypothesis (H_o)
- Alternative Hypothesis (H_1)

Step 2: Select Level of Significance (α)
Commonly used levels are 0.05 (5%) or 0.01 (1%).

Step 3: Choose Statistical Test
Examples include:

- t-test
- z-test
- Chi-square test

Step 4: Calculate Test Statistic
Using the collected data, calculate the test value through the selected statistical method.

Step 5: Decision Making
Compare the calculated value with the critical value or check the p-value.

- If p-value ≤ 0.05 → Reject the Null Hypothesis
- If p-value > 0.05 → Accept the Null Hypothesis

Step 6: Draw Conclusion
Interpret the result in simple language related to the research problem.

6. Importance of Hypothesis Testing

- Provides scientific basis for conclusions
- Reduces bias in research
- Ensures objectivity

7. Limitations of Hypothesis Testing

- Results depend on sample size

- Risk of Type I and Type II errors
- Statistical significance may not imply practical importance

8. Conclusion

The development of a working hypothesis is a fundamental step in research methodology. It provides direction and clarity to the research process. A well-formulated hypothesis guides data collection and analysis. Hypothesis testing ensures that conclusions are based on scientific evidence rather than personal opinion. Therefore, both development of working hypothesis and hypothesis testing are essential for conducting systematic and reliable research.
